microns

Next Generation Mobile Sanitization Dispenser

SaniCart™ is a mobile, fogging sanitization system, used to protect against surface and airborne viral, bacterial, and mold contamination. The SaniCart™ technological breakthrough involves a patented micro-fog nozzle, which humidifies the entire room with any disinfectant including peracetic acid, hydrogen peroxide, chlorine dioxide, citric acid, or any other EPA-approved viral biocide.

Compared to hand-held or aerosol sprayers, this fine disinfecting fog efficiently covers the complete indoor environment, including all surfaces and hard-to-reach areas without leaving moisture and residues.

SaniCart™ technology helps reduce human error and minimize user exposure to sanitizing chemicals and pathogens, while also saving time, money, and labor.

✓ EFFECTIVE

6-10 micron droplet size ensures disinfecting solution coats all surfaces without leaving behind any damaging residue.

✓ VERSATILE

Easy maneuverability allows it to work in any environment where effective sanitation is required, including guest rooms, dining areas, restrooms, common areas and banquet spaces.

✓ EFFICIENT

Gets in all the nooks and crannies without excess waste and disinfects most hotels inside of 20 minutes.

✓ ECONOMICAL

Fraction of the cost compared to manual hand held sanitation processes. Proactive approach for preventing liability for cross contamination.
